

Exchange Server Mailbox Recovery & Mail Flow Manual

Document Version: 1.0 (Strictly Internal)

1. Outlook Synchronization Sync Failures

Outlook clients occasionally lose synchronization with the Exchange Mailbox Server.

This presents as error code 0x80040115 and shows Outlook status as 'Offline'.

To resolve local sync issues:

1. Close the Outlook client application.
2. Open the directory %localappdata%\Microsoft\Outlook in file explorer.
3. Locate the .ost offline data cache file corresponding to the user profile.
4. Rename or delete the .ost file. (Outlook will rebuild it on next start).
5. Restart Outlook. Mailbox sync should successfully resume.

2. External Mail Delivery Delays

If incoming external emails are delayed but internal messaging resolves instantly, the bottleneck is located on the external SMTP Gateway or Mail Delivery Proxy Server.

Troubleshooting procedure:

1. Log into the SMTP Proxy administration console.
2. Check the message queues for blocked, deferred, or grey-listed emails.
3. If queue congestion is detected, flush the queue to resume normal mail flow.
4. Monitor traffic to ensure no external IP is performing a denial-of-service spam attack.
